

REVERSE STRING PROBLEM

Write a program to implement the following requirement:

The program will read from standard input any text up to 10,000 characters and print to standard output a string that is made of these characters but in reverse order.

Note that the input text can be empty, or a bunch of empty lines, or a mix of empty lines and texts, any character possible. The output consists of the reversed string only. Do not introduce any other character.

There will be 5 test cases, each worth 20 points.

SAMPLE INPUT

line 1

line whatever here

SAMPLE OUTPUT

ereh revetahw enil

1 enil
